Antarctic Peninsula (January-February, 2011)

The campaign at Escudero (“Base Profesor Julio Escudero”, 62° 12’ S; 58° 57’ W) was aimed at studying some of the characteristic of the local UV climatology.

The campaign required shipping roughly 1 Ton of equipment and involved a team of 8 researchers (including 1 postdoc, 3 Phd students and 3 undergraduate students) from the Universidad de Santiago (USACH) and the University of Hannover (Germany, IMUK).

The team carried out quality-controlled spectral measurements of the UV irradiance as well as of the sky UV radiance distribution (by using a state-of-the-art sky scanner system).
